How to update DataExchange scripts after an upgrade

Procedure Steps

System database links need to be updated after an OnGuard version upgrade. In FormsDesigner:

- 1) From the **DataExchange** menu, select **Open**.
- 2) Select the DataExchange script you wish to open, and then click [Open].
- 3) From the **DataExchange** menu, select **System DB Links**.
- 5) A "Refresh Database Schema" dialog box will be displayed with the following message: Some of the tables\views have changed. Please note that deleted fields will cause any mapped data to be deleted as well. Would you like to refresh your tables\views? Click [Yes]. Select [Close] on the System Database Links dialog box without modifying anything.
- 6) From the **DataExchange** menu, select **Save**. Select [Ok] if you are prompted with a dialog box regarding the adding of default data to missing fields.
- 7) Run the DataExchange script again; it should now be updated to work with the new version of OnGuard.

Applies To

OnGuard (All versions)

Additional Information

None
